                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   S
                                                                                                                                                                                                                                                                            Ś
                                                                                                                                                                                                                                                                                                                                     밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CC The marker protein is preferably a type A beta-lactamase, especially TEM-
CC 1 beta-lactamase of Escherichia coli. The oligopeptide is a member of a
CC proteome library selected from single chain antibody FV fragment library,
CC an antibody light chain variable region library and a peptide library,
CC displayed within thioredoxin. The IGEA systems are useful for detecting
CC and identifying interactions between intracellular as well as selecting systems are also useful in selecting with a single marker protein the
CC incorporation of multiple genetic traits in a host cell. In particular,
CC diagnostics and prognostics, as well as in high-throughput screening
CC systems for the discovery and validation of pharmaceutical targets and
CC drugs. Prior systems (e.g. E. coli Dimer Detection System) yeast two-
CC hybrid system or Selective Infective Phage System) require multiple steps
CC between interaction and phenotype, which cause severe loss of efficiency
CC between interaction and phenotype, which cause severe loss of efficiency
CC due to high false positive and false negative rates. The present system
CC dependent enzymes find use in cell-based sensors for activation or
CC dependent enzymes find use in cell-based sensors for activation or
CC dependent enzymes find use in cell-based sensors for activation or
CC dinhibition of metabolic or signal transduction pathways, in high-
CC dinhibition of metabolic or signal transduction pathways, in high-
CC dinhibition of metabolic or signal transduction of inhibitors within and

                                                                                                                                                           δ
                                                                                                                                                                                                                                                                The present invention describes a fragment complementation system (I) which comprises a first oligopeptide (OP1) containing an N-terminal CC fragment with a C-terminal break point and a second oligopeptide (OP2) CC comprising a C-terminal which a N-terminal breakpoint, in which the C and CC N terminal fragments are both derived from a marker protein (MP) and CC reassemble to form a functionally reconstituted MP. Methods from the CC protein interactions in a sample, identifying oligopeptide interactions between two different proteomes, identifying epitopes that bind to an CC immunoglobulin (Ig) variable region, for identifying interactions between a extracellular domain of a transmembrane protein and a polypeptide, for high-throughput identification of compounds that inhibit phosphorylation-CC regulated signal transducers, forming a enzyme complementation system for compound in an host who is in need of it. The present sequence represents CC the Escherichia coli mature TEM-1 beta-lactamase, which is used in the cx categorial transcription of invention

Ct terminal fragment each are derived from a marker protein and treasemble to form a functionally reconstituted marker protein. (I) is useful for selecting simultaneous incorporation of multiple genetic elements into a compound in a host. The method described is useful for identifying a compound in a host. The method described is useful for identifying a compound in a host. The method described is useful for identifying a compound in a host. The method described is useful for identifying a compound in a host. The method is useful for identifying a compound in a host. The method is useful for identifying a compound in a become oligopeptide. Binding of the first coligopeptide to the second oligopeptide. Binding of the first coligopeptide to the second oligopeptide results in the functional compound to respect to the marker protein. The method is also useful for compound in a sample; and identifying oligopeptide interactions between two different proteomes; compound identifying epitopes that bind to an immunoglobulin variable region. (I) or an expression casette (II), encoding a selectable N or C-terminal compound in a useful for identifying interactions between an extra cellular domain of a transmembrane protein and a polypeptide, where the compound that the protein with high throughput identification of compound that compound that phosphorylation-regulated cell signal transducers. (I) or efficiently detects multiple interaction between extracellular and compound that the sequence of antibiotic resistance enzyme TEM-1 beta-lactamase that can be used as a selectable gene in the fragment complementation system of the compound contraction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention describes a fragment complementation system (I) comprising a first oligopeptide having an N-terminal fragment with a C-terminal break-point, and a second oligopeptide having a C-terminal fragment with a N-terminal break-point, where the N-terminal fragment and the C-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         fragment complementation system; marker protein; multiple genetic element incorporation; antibiotic resistance; beta-lactam derivative activation; anti-tumour compound; beta-lactam derivative activation; anti-tumour compound; functional reassembly; protein-protein interaction; proteome interaction; immunoglobulin variable region; immune cell protein; CD40; phosphorylation-regulated cell signal transducer; TEM-1 beta-lactamase;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Fragment complementation system for detecting immunoglobulin epitope, has first oligopeptide containing N-terminal fragment with C-terminal breakpoint, second oligopeptide containing C-terminal fragment with N-terminal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Balint RF,

                                                                         Escherichia coli beta-lactamase (AAW16634), including the signal peptide, is the expression product of a molecular chimaera, designated pCMV-BL (AAT66737), in which the beta-lactamase gene is under control of the CMV intermediate/early promoter. Vectors consisting of a transcriptional regulatory DNA sequence linked to a beta-lactamase gene can be used for enzyme prodrug therapy. Expression of the beta-lactamase in a targetted cell allows conversion of a prodrug into an agent toxic to the cell for treatment of cancer, viral (e.g. HIV) infection or inflammation. Secretion of the enzyme has the advantage of increasing neighbouring cell

                                                                                                                                                                                                                                                                                                                                                          The expression constructs pRNH127 and pRNH155 contain identical sequences but were constructed using different strategies (see AAQ36498). The constructs comprise exons 2-7 of human CYP1A1 gene under the construct of the inducible mouse metallothionein (MMT-1) promoter. The constructs also contain an open reading frame in the opposite orientation to the cytochrome P450 exons. This ORF encodes ampicillin resistance. The constructs are suitable for transformation of human fibroblasts derived from the xeroderma pigmentosum group A. Cultures of the transformed fibroblasts can be used to test substances for mutagenicity. The presence of the inducible cytochrome P450 gene allows metabolism of the substance to mutagenic metabolites. (Updated on 10-MAR-2003 to add missing OS

Beta-lactamase delivery to mammalian cells confers sensitivity to cephalosporin prodrugs. Liposomal DNA/5-fluorouracil prodrug combinations resulted in s.c. tumour regression in mice bearing A549 tumours. Survival of mice bearing human large cell lung H460 intrathoracic (i.t.) tumours was increased upon i.t. injection of the secretory beta-lactamase DNA
                                                                                                                                                                                                                                                                                                                                                                                                                           A secretory beta-lactamase (AAR97619) is expressed from DNA construct pCMV-BL (AAT29220), in which the beta-lactamase coding sequence is under

Two clones, pRNH127 and pRNH15, were isolated by different methods and which both had the same sequence. The CYPIA1 construct is used in assays to test for cytotoxicity of humans to a chemical. The method comprises exposing human fibroblast cells normally not including any cytochrome P450 activity to potentially toxic chemicals. The cells having been transformed to express cytochrome P450, under the control of a controllable promoter through the CYPIA1 gene, upon exposure to the chemical in vitro. The chemical is metabolised intracellularly into a cytochrome metabolite by oxidation within the fibroblasts through the intracellular cytochrome P450 mixed function oxidane environce actionable through the intracellular cytochrome P450 mixed function oxidane environce actionable through the intracellular cytochrome P450 mixed function oxidane environce actionable through the intracellular cytochrome P450 mixed function oxidane environce actionable through the intracellular cytochrome P450 mixed function oxidane environce actionable through the intracellular cytochrome P450 mixed function oxidane environce p450 mixed function environce p450 mixed function oxidane environce p450 mixed fu
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             oxidase enyzmes expressed by the cells. Gene damage in the test cells is detected as an indication of cytotoxicity of the chemical. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Testing chemicals for cytotoxicity to human by using recombinant fibroblasts transformed with control of inducible promoter.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       cytochrome; P450; metallothionein; mouse; metabolism.

                                                                                                                                                                                                                                                                                                                                 Escherichia coli beta-lactamase (AAW16635), lacking the signal peptide, is the expression product of a molecular chimaera, designated pCMV-delBL (AAT66738), in which the beta-lactamase gene is under control of the CMV intermediate/early promoter. Vectors consisting of a transcriptional regulatory DNA sequence linked to a beta-lactamase gene can be used for enzyme prodrug therapy. Intracellular expression of the beta-lactamase in a targetted cell allows conversion of a prodrug into an agent toxic to the cell for treatment of cancer, viral (e.g. HIV) infection or
                                    Secretory beta-lactamase.

                                                                                                                                                                                                                                                                                                                                                                                           밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes a novel tetracycline assay that uses recombinant CC prokaryotic cells comprising a luciferase gene under the transcriptional CC control of a tetracycline repressor and tetracycline promoter and CC involves the detection of luminescence emitted form the cells. The assay CC involves the detection of luminescence emitted form the cells. The assay CC can be used to distinguish tetracycline form other microbial agents. The CC invention also describes a novel plasmid comprising either the luxCDABB CC genes, a tetracycline repressor (TetR) and a tetracycline promoter (TetA) from Tn10. The tetracycline promoter (TetA) from Tn10. The tetracycline assay CC method can be used for the determination of tetracycline. The method can also be used for the determination of the medicine. The method can CC e.g. to study the dosage and penetration of the medicine. The method can also be used to test cheese production, as cheese making bacteria are not can be used to the presence of tetracycline. The method can also be used co determine the presence of tetracycline. The method can also be used concentration of antibiotics in foodstuffs, CC e.g. for allergic people. The present assay method does not rely on the growth of microbes as do conventional tests, and so is much more rapid. The present assay is also more sensitive, as even a small amount of luminescence can be detected
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Best Local Similarity Matches 149; Conserv

                                                                                                                                                                                                                                                S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CC This invention describes a novel method for the selection of monoclonal CC antibodies (MAb) which comprises (i) fusing B lymphocytes with myeloma CC cells to produce antibody-producing hybridomas such that the antibodies CC are presented at the surface of the hybridomas by an antibody-binding protein (I); and (ii) binding the antibody to antigens (Ag). The CC invention also describes antibody-binding proteins (I) that comprise a CC combination of the signal peptide of a murine immunoglobulin (Ig) kappa CC thain or a murine MHC (major histocompatibility complex) Class I k(k) CC molecule; an antibody-binding site of proteins A, G, L or LG, and the CC transmembrane domain of PDGFR (platelet-derived growth factor receptor) CC or CD52. The method is used to select MAb with specificity for particular antigens. MAb can be selected without separate culture of hybridomas, and CC election can be made against many antigens in a library, optionally on CC mixtures of hybridomas can be used for selection, reducing the time and CC mixtures of hybridomas can be used for selection, reducing the time and CC cost involved in MAb selection. This sequence represents the bla protein CC bla protein, Neo-R and protein G described in the method of the invention

                                                                                                                                                                                                                                                                                                                                                                          뮍
                                                                                                                                                                                                                                                                                                                                                                                                        S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention describes a novel method for the selection of monoclonal CC antibodies (MAb) which comprises (i) fusing B Jymphocytes with myeloma CC cells to produce antibody-producing hybridomas such that the antibodies CC are presented at the surface of the hybridomas by an antibody-binding protein (I); and (ii) binding the antibody to antigens (Ag). The CC invention also describes antibody-binding proteins (I) that comprise a CC combination of the signal peptide of a murine immunoglobulin (Ig) kappa CC chain or a murine MHC (major histocompatibility complex) Class I k(k) CC molecule; an antibody-binding site of proteins A, G, L or LG, and the CC transmembrane domain of pogera (plattelet-derived growth factor receptor) CC or CD52. The method is used to select MAb with specificity for particular CC antigens. MAb can be selected without separate culture of hybridomas, and CC selection can be made against many antigens in a library, optionally on CC the basis of strength of affinity for a particular antigen. Complex CC mixtures of hybridomas can be used for selection, reducing the time and CC cost involved in MAb selection. This sequence represents the Neo-R CC cost involved in MAb selection. This sequence represents the Neo-R CC bla protein, Neo-R and protein G described in the method of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      protein (I); and (ii) binding the antibody to antigens (Ag). The invention also describes antibody-binding proteins (I) that comprise a combination of the signal peptide of a murine immunoglobulin (Ig) kappa chain or a murine MHC (major histocompatibility complex) Class I k(k) molecule; an antibody-binding site of proteins A, G, L or LG, and the transmembrane domain of DGFR (platelet-derived growth factor receptor) or CD52. The method is used to select MAb with specificity for particular antigens. MAb can be selected without separate culture of hybridomas, and selection can be made against many antigens in a library, optionally on the basis of strength of affinity for a particular antigen. Complex mixtures of hybridomas can be used for selection, reducing the time and cost involved in MAb selection. This sequence represents the bla protein protein contained in the expression vector pSEXIIG2 which contains the bla protein, Neo-R and protein G described in the method of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is given in a specification relating to a CC recombinant host cell suitable for simultaneous maccharification and CC fermentation. The host cell contains at least one heterologous CC polynucleotide encoding a polysaccharase under the transcriptional CC polynucleotide encoding a polysaccharase under the transcriptional CC control of a surrogate promoter capable of increasing expression of the CC polysaccharase. The host cell also contains a second heterologous CC polynucleotide encoding a secretory polypeptide to facilitate the CC secretion of the expressed polysaccharase. The recombinant host cell is CC useful for producing polysaccharase which is useful for enzymatically CC degrading oligosaccharides such as lignocellulose, hemicellulose, CC cellulose, pectin or their combinations, and fermentation processes. The present sequence is encoded by an integration vector which was introduced CC into cells to generate recombinant host cells. The vector contains a CC chrosepthem is received by an integration vector which was introduced contained and contains a contained processes.

BIOTECHNOLOGY: This protein is used as a marker in many commonly used cloning vectors, such as pBR322 and the pUC series.

MISCELLANEOUS: The beta-lactamase present on pBR322 was cloned
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           enterobacteria; they hydrolyze the beta-lactam bond in susceptible beta-lactam antibiotics, thus conferring resistance to penicillins and cephalosporins. TEM-3 and TEM-4 are capable of hydrolyzing cefotaxime and ceftazidime. TEM-5 is capable of hydrolyzing ceftazidime. TEM-6 is capable of hydrolyzing ceftazidime. TEM-6 is capable of hydrolyzing ceftazidime. TEM-8/CAZ-2, TEM-16/CAZ-7 and TEM-24/CAZ-6 are markedly aztreonam. TEM-8/CAZ-2, TEM-16/CAZ-7 and TEM-24/CAZ-6 are markedly
                                                                                                                                                                                                                             from plasmid R1 (R7268). SIMILARITY: Belongs to the class-A beta-lactamase family.
